1 Cubed Fourier

(a) Cubing the $9^{th}$ roots of unity gives the $3^{rd}$ roots of unity. Next to each of the third roots below, write down the corresponding $9^{th}$ roots which cube to it. The first has been filled for you. We will use $\omega_9$ to represent the primitive $9^{th}$ root of unity, and $\omega_3$ to represent the primitive $3^{rd}$ root.

$\omega_3^0 : \omega_9^0,$

$\omega_3^1 : , ,$

$\omega_3^2 : , ,$

(b) You want to run FFT on a degree-8 polynomial, but you don’t like having to pad it with 0s to make the (degree+1) a power of 2. Instead, you realize that 9 is a power of 3, and you decide to work directly with $9^{th}$ roots of unity and use the fact proven in part (a). Say that your polynomial looks like $P(x) = a_0 + a_1 x + a_2 x^2 + \ldots + a_8 x^8$. How do you split $P(x)$ to use the fact proven in part (a) to your advantage? Provide either the polynomial, or explain how the vector can be divided to recurse on. Recall that for the FFT algorithm shown in the book, we split a given polynomial $Q(x) = A_e(x^2) + x A_o(x^2)$, and we define what $A_e(x^2)$ and $A_o(x^2)$ are. Correspondingly, in lecture you saw the $\vec{a}$ split into $\vec{a}_{\text{even}}$ and $\vec{a}_{\text{odd}}$. 
2 Graph Traversal

(a) For the directed graph above, perform DFS starting from vertex A, breaking ties alphabetically. As you go, label each node with its pre- and post-number, and mark each edge as Tree, Back, Forward or Cross.

(b) What are the strongly connected components of the above graph?
3 Finding Clusters

We are given a directed graph $G = (V, E)$, where $V = \{1, \ldots, n\}$, i.e. the vertices are integers in the range 1 to $n$. For every vertex $i$ we would like to compute the value $m(i)$ defined as follows: $m(i)$ is the smallest $j$ such that vertex $j$ is reachable from vertex $i$. (As a convention, we assume that $i$ is reachable from $i$.) Show that the values $m(1), \ldots, m(n)$ can be computed in $O(|V| + |E|)$ time.

(c) Draw the DAG of the strongly connected components of the graph.
